

STRATEGIC PARTNER BRIEFING

TRAIN. CONNECT. COMPETE.

A connected Jiu-Jitsu platform with a proof-first path to intelligent competition.

CORE PLATFORM: FEASIBLE
BODY TRACKING: STAGED VALIDATION
AUTONOMOUS SCORING: NOT AN EARLY PROMISE

Jiu-Jitsu still lives across disconnected systems

Training, identity, gyms, competition, media, and reputation rarely share one trusted record.

THE COST OF FRAGMENTATION

Every disconnected workflow loses context, trust,
and the evidence needed to improve the sport.

One network can make every interaction compound

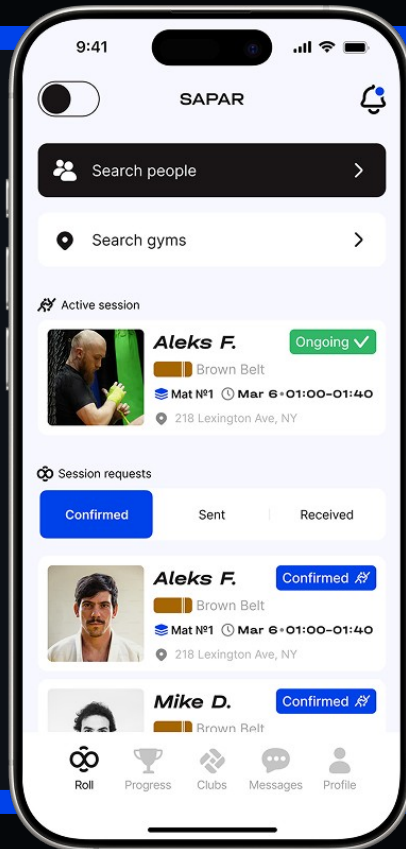

A shared identity, event, result, and media layer connects the people and places that already make the sport work.

The network grows useful before advanced AI arrives.

For fighters, SAPAR turns mat time into momentum

Find the right session, build a credible record, share the journey, and understand progress in one place.

01

DISCOVER

People, gyms, sessions, and opportunities to roll.

02

PROVE

Verified results and explainable ratings, distinct from XP.

03

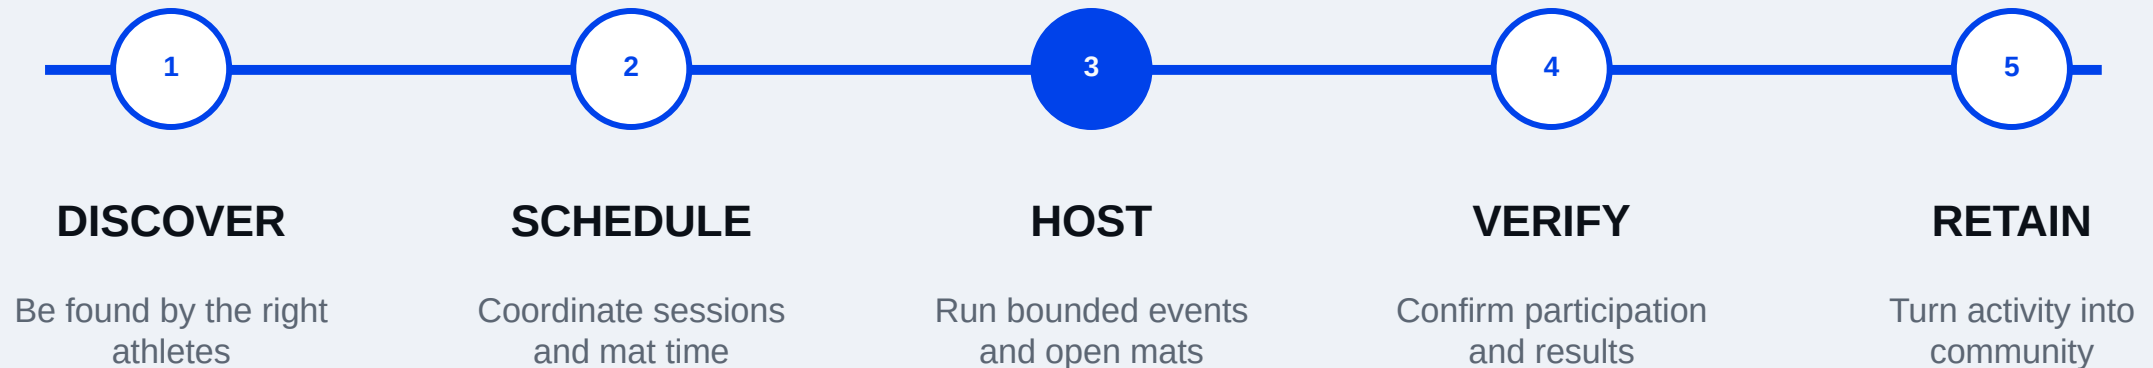

BELONG

A combat-sports community built around real participation.

Product concept - experience details require pilot validation.

For gyms, the network becomes an operating advantage

Discovery and scheduling can lead into verified participation, hosted competition, and a stronger local community.

Prove repeatable operations with one-to-three partner gyms before scaling.

Build the platform. Earn the intelligence.

FEASIBLE NOW

CONNECTED CORE

Identity, profiles, gyms, events, result ledger, ratings, media workflows, and bounded community.

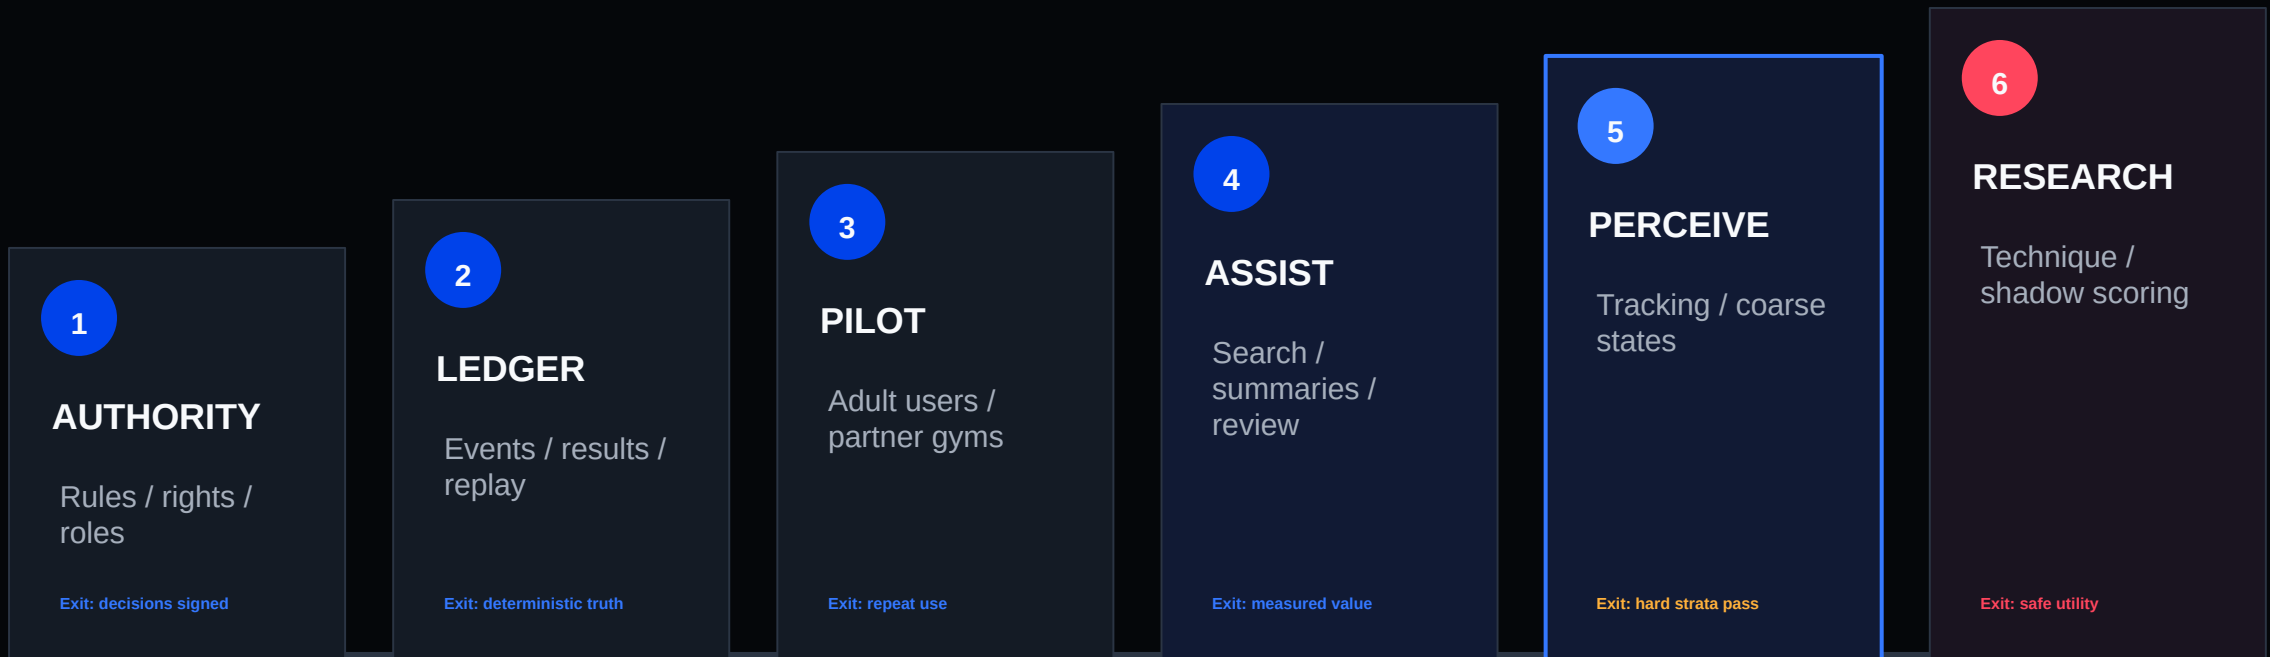

PROVE FIRST

PERCEPTION + SCORING

Tracking, positions, technique understanding, live analysis, and any scoring suggestion require staged evidence and human authority.

The order is the strategy

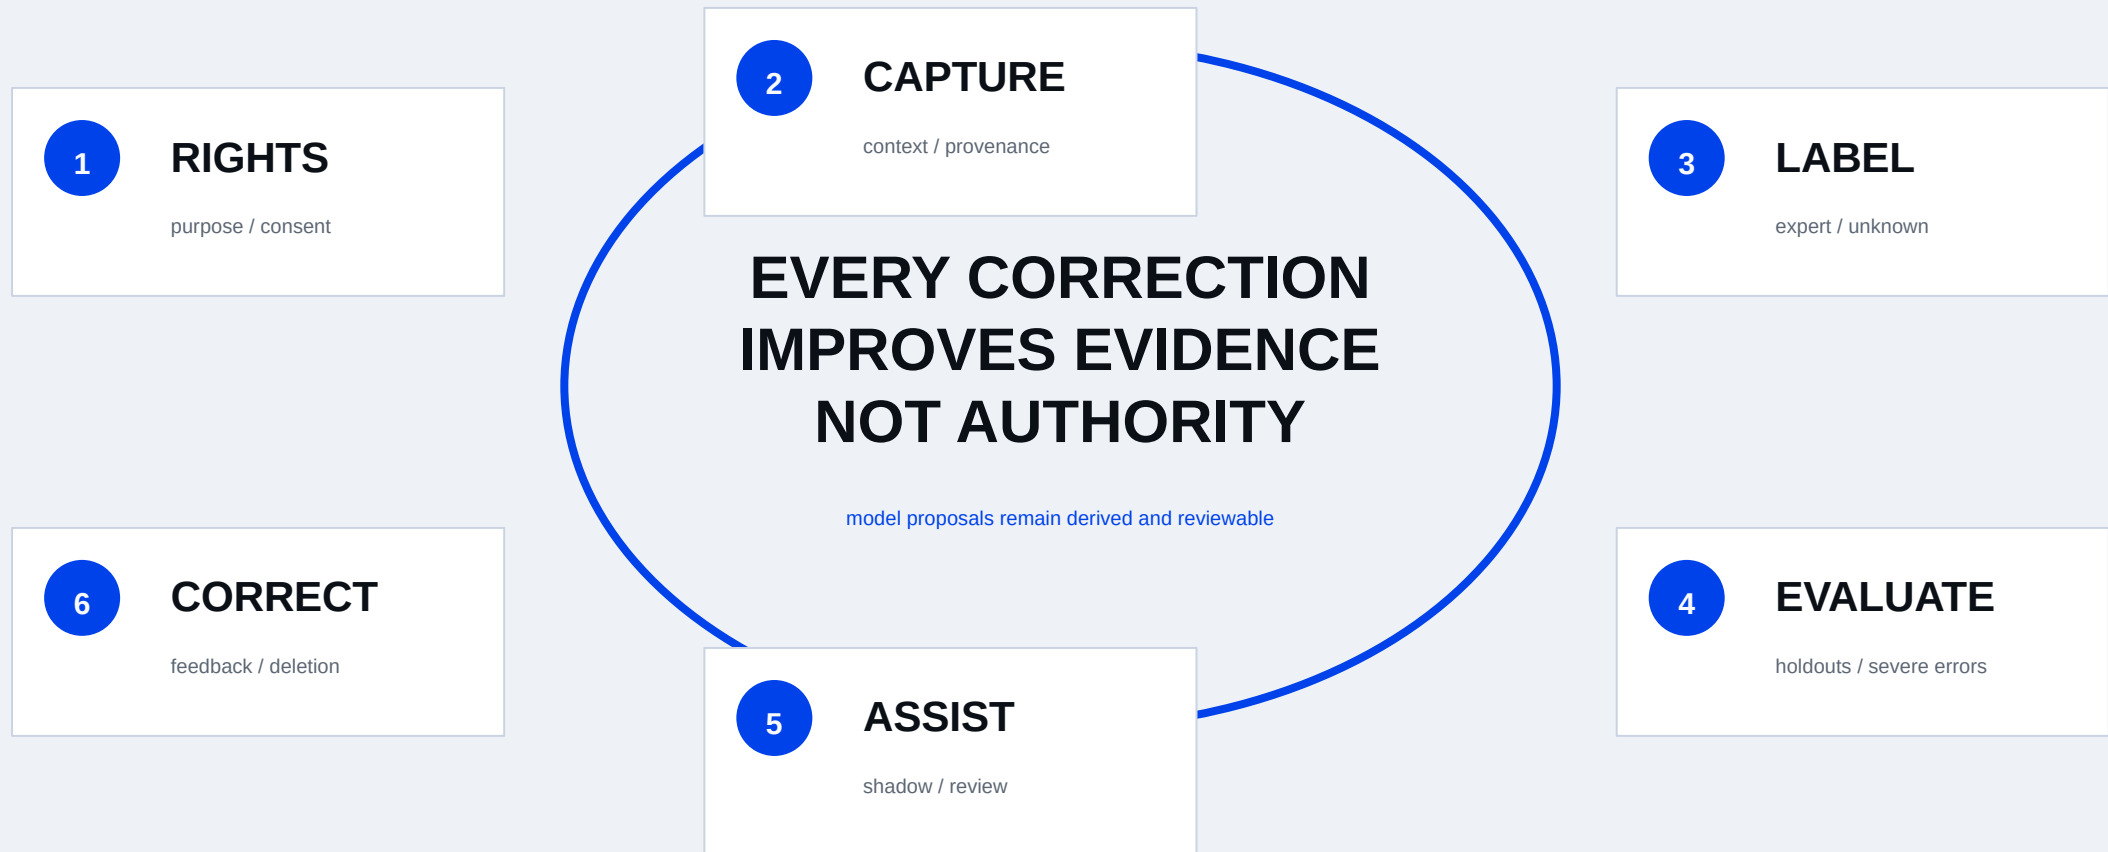

Each stage earns the evidence, data, and operational confidence required by the next.

No phase advances because the calendar moved. It advances because the exit evidence exists.

The data flywheel starts with rights, not volume

Product value creates governed evidence. Governed evidence earns bounded automation. Human corrections shape the next experiment.

Body tracking is a validation ladder, not a launch feature

Close contact, occlusion, changing cameras, rulesets, and identity swaps make grappling harder than generic sports tracking.

SAPAR / BODY TRACKING RESEARCH

Boat - blue 0.931
Takedown - red 0.0855
Mount - red 0.0161
Slide control - red 0.0137
Turtle - red 0.000318

EXISTING CONCEPT IMAGE - VALIDATION REQUIRED

A visual concept does not establish tracking, technique, or scoring accuracy.

Inference stability can help - after a transfer test

A team-reported capability could help evaluation discipline, but language-model stability and vision-model drift are different problems.

TEAM-REPORTED CAPABILITY

Inference-stability control

Potential reuse: versioning, deterministic harnesses, regression detection, rollback, and reproducible evaluation.

SAPAR-SPECIFIC PROOF REQUIRED

Temporal + domain stability

Body tracking can drift across athletes, gyms, cameras, lighting, occlusion, uniforms, rulesets, venues, and time.

1

REPEAT

2

TRANSFER

3

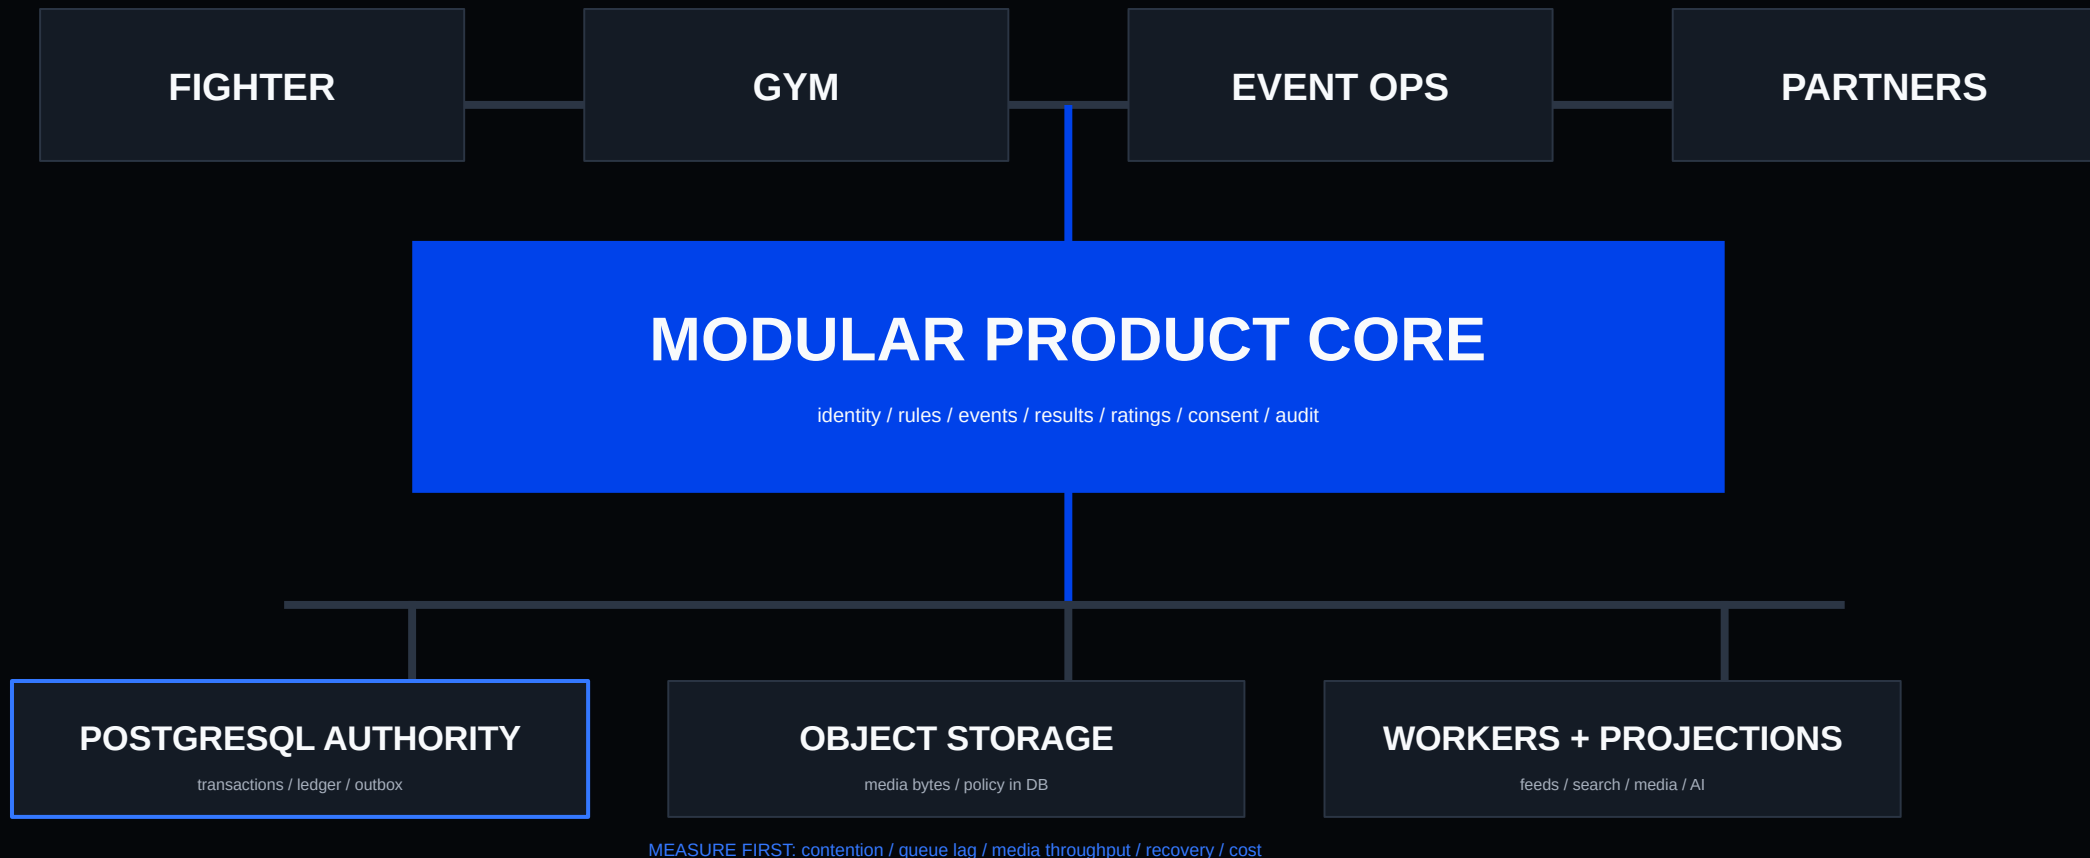

COMPARE

4

ROLL BACK

Scale around one source of truth

Start coherent. Split systems only when measured workload, reliability, or ownership pressure justifies the move.

Make every material unknown testable

SAPAR should convert each material uncertainty into an owner, a test, and a stop condition.

RIGHTS + PRIVACY

Footage can include opponents, referees, crowds, voices, minors, and biometric signals.

Gate: explicit purpose, consent, withdrawal, deletion, and counsel review.

MODEL + DATA

Aggregate accuracy can hide failure by athlete, gym, camera, occlusion, style, or time.

Gate: hard-strata reporting, holdouts, calibration, and abstention.

RULES + TRUST

Wrong rules, self-approval, disputes, collusion, or rating manipulation can corrupt credibility.

Gate: versioned rules, separation of duties, replay, corrections, and appeals.

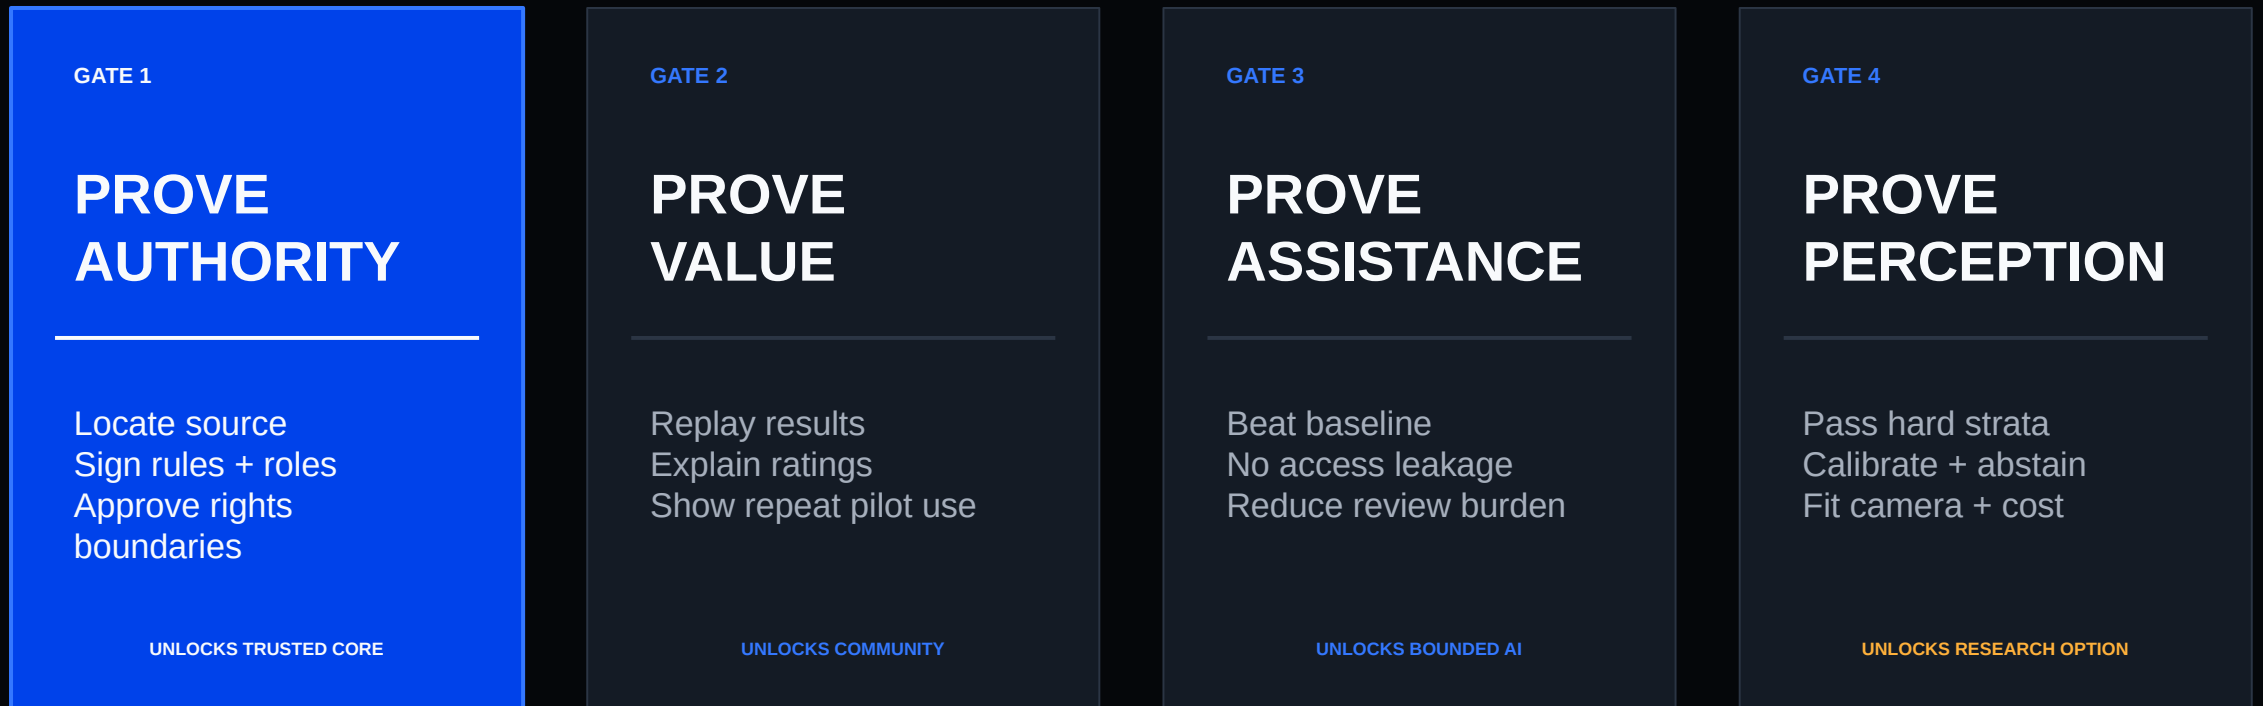

OPERATIONS + SCALE

Media cost, review queues, incident response, and recovery can fail before traffic does.

Gate: workload budgets, service objectives, drills, and measured breakpoints.

Fund completed evidence, not elapsed time

The program advances through four decision gates. Later AI options remain visible without becoming premature commitments.

PHASES 0-6 / TIMING FOLLOWS EVIDENCE / RESEARCH CAN NARROW OR STOP

THE NEXT MOVE

Start with one closed, adult-only pilot.

Prove the trusted competition core. Create the data flywheel. Advance body tracking only when the evidence earns it.

**BUILD THE TRUSTED NETWORK.
EARN THE DATA. THEN AUTOMATE.**

01

PILOT ACCESS

Selected gyms, events, operators, and representative capture conditions.

02

DOMAIN AUTHORITY

Rules-qualified officials, privacy review, and explicit data rights.

03

STRATEGIC SUPPORT

Product, operating, and capital partnership shaped around proof gates.

Commercial structure and investment terms to be defined with SAPAR leadership.
